

HILL COUNTRY PEDIATRICS
Established Patient Visit

Patient: Nguyen, Mai
DOB: 2017-09-30 (age 6) MRN: HCP-998-877
Date of Service: 02/28/2024
Rendering Provider: Beatrice Holloway, MD (Pediatrics)
Encounter Type: Established patient, moderate complexity (CPT 99214)

CHIEF COMPLAINT

Persistent cough x 12 days; mom reports worsening overnight wheezing.

HPI

6-year-old female brought in by mother with 12 days of nonproductive cough, now associated with nighttime wheeze and tactile fever to 100.4°F. Mother reports decreased oral intake, less playful than baseline, and one episode of post-tussive emesis last night. Prior diagnosis of intermittent asthma at age 4; uses albuterol PRN – has needed it every 4-6 hours for past 3 days. No known sick contacts. Up to date on immunizations.

ROS

Constitutional: subjective fever; ENT: rhinorrhea; Resp: cough, wheeze; GI: emesis x1 last night; Skin: no rash. Otherwise negative.

EXAM

Vitals: T 100.1°F HR 122 RR 26 SpO2 95% RA
Gen: Tired-appearing but consolable.
HEENT: TMs clear bilaterally, oropharynx erythematous without exudate.
Resp: Mild end-expiratory wheeze diffusely, mild subcostal retractions at rest, prolonged expiratory phase.
CV: Tachycardia, no murmur.
Abd: Soft, NT.

ASSESSMENT/PLAN

1. Acute asthma exacerbation (J45.901) – moderate severity.
 - Albuterol nebulizer 2.5 mg in clinic, repeated x2. Reassessed post-treatment: SpO2 98%, RR 22, retractions improved, wheeze markedly reduced.
 - Prescribed oral prednisolone 1 mg/kg/day x 5 days.
 - Continue albuterol HFA 2 puffs q4h prn for 72 h, then taper.
2. Viral URI (J06.9) – likely trigger. Supportive care.
3. Anticipatory guidance: return precautions reviewed (work of breathing, inability to speak in full sentences, persistent fever, dehydration).

E/M LEVEL: 99214 – established patient, moderate-complexity MDM (acute illness with systemic symptoms, prescription drug management).

Follow-up: 1 week (sooner prn). Asthma action plan updated and provided to caregiver.
